Deaths Attributable to P&I – Maine, 2017-19

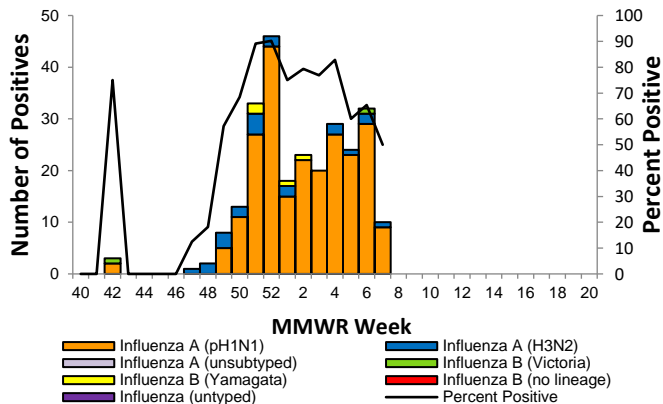

*This number represents the number of individuals who had influenza specifically listed on their death certificate. This is likely an underrepresentation of the true burden, as many influenza-associated deaths are due to secondary infections. This is why Maine CDC reports Pneumonia and Influenza (P&I) deaths.

Antigenic Characterization (Vaccine Strain Match)

- Federal CDC has antigenically or genetically characterized 968 influenza viruses from September 30–February 9, 2019.
 - 98.5% of influenza A/H1N1 samples match the vaccine strain
 - 66% of influenza A/H3N2 samples match the vaccine strain
 - 71.4% of influenza B/Victoria samples match the vaccine strain
 - 100% of influenza B/Yamagata samples match the vaccine strain
- Antigenic characterization shows if the circulating strains are the same strains that were used to make the vaccine. This does not tell you how effective the vaccine is at creating an immune response. For current vaccine effectiveness rates visit <https://www.cdc.gov/mmwr/volumes/68/wr/mm6806a2.htm>.

A Weekly Influenza Surveillance Report Prepared by the Influenza Division

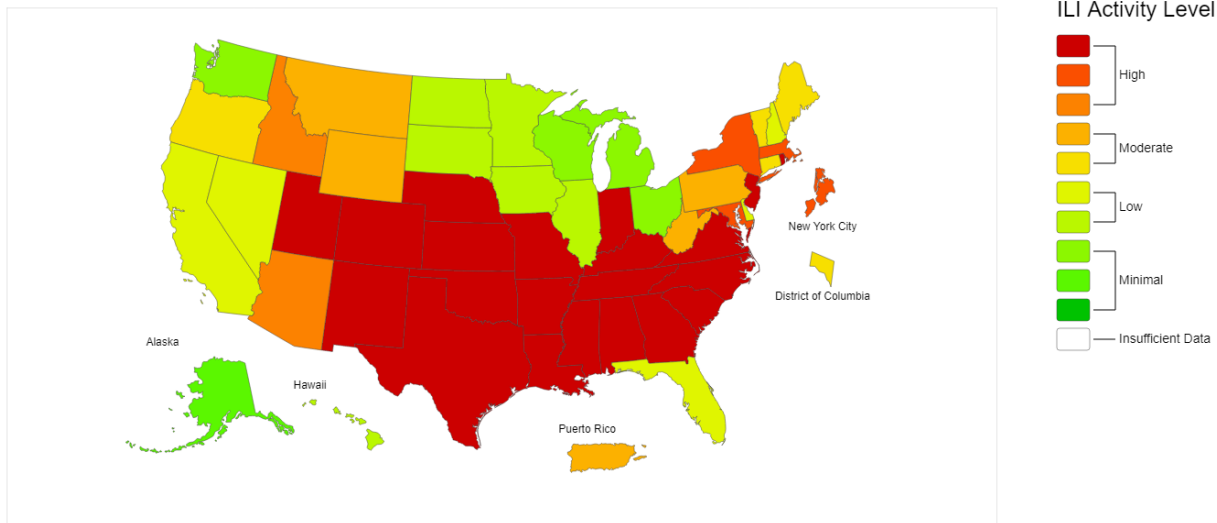

Weekly Influenza Activity Estimates Reported by State and Territorial Epidemiologists*

Week Ending Feb 09, 2019 - Week 6

*This map indicates geographic spread and does not measure the severity of influenza activity.

2018-19 Influenza Season Week 6 ending Feb 09, 2019

*This map uses the proportion of outpatient visits to healthcare providers for influenza-like illness to measure the ILI activity level within a state. It does not, however, measure the extent of geographic spread of flu within a state. Therefore, outbreaks occurring in a single city could cause the state to display high activity levels.
*Data collected in ILINet may disproportionately represent certain populations within a state, and therefore may not accurately depict the full picture of influenza activity for the whole state.
*Data displayed in this map are based on data collected in ILINet, whereas the State and Territorial flu activity map are based on reports from state and territorial epidemiologists. The data presented in this map is preliminary and may change as more data is received.
*Differences in the data presented by CDC and state health departments likely represent differing levels of data completeness with data presented by the state likely being the more complete.
*For the data download you can use Activity Level for the number and Activity Level Label for the text description.
